RE: Site Inspection, SM/027/009, EXP/027/012(A & B), Utah
Perlite Project, Manville Corporation

On July 13, 1988 Holland Shepherd and I inspected Manville Corporation's Beaver and Caster Claims. Numerous shallow drill holes of 2 1/4" diameter have been drilled on these claims from 1985 to 1987. Surface disturbance has been negligible. The drill holes are plugged with cement, marked by a metal fence post, and are tagged.

We also visited the site of the bulk sample program that was conducted during 1986 and 1987. Pits and trenches were excavated to a depth of ten feet and cover approximately two acres. This is the same location that Manville Corporation filed a small mine notice on in December, 1987.

No attempt was made to inspect the Black Springs claims which are located several miles further to the east.
